

**Project Title: Deployment of Ubuntu Server
and Implementation of LVM on Ubuntu Server
for Flexible Disk Management**

Name : Kundrapu Ram Kumar

Lab ID : 25VID0885_U11

User ID : 27751

Batch : 25VID0885_DC_04

Table of Contents:

S.No	Section Title	Description
1	Introduction	Provides an overview of the importance of server deployment and storage management using Ubuntu and LVM.
2	What is Ubuntu Server?	Explains the features, benefits, and uses of Ubuntu Server in IT environments.
3	What is LVM (Logical Volume Management)?	Describes LVM, its components, and the advantages it offers for flexible disk management.
4	Prerequisites	Lists the hardware, software, and technical knowledge required before beginning the setup.
5	Objective	States the purpose of the documentation and outlines what will be achieved.
6	Ubuntu Server Installation – Step-by-Step	Details the complete process of installing Ubuntu Server on VMware.
7	LVM Implementation – Step-by-Step	Provides step-by-step instructions for creating and configuring LVM on the Ubuntu Server.
8	Conclusion	Summarizes the implementation and highlights the benefits of using Ubuntu Server with LVM.

Deployment of Ubuntu Server and Implementation of LVM on Ubuntu Server for Flexible Disk Management

Introduction

In the modern world of IT infrastructure, server deployment and efficient storage management are key components for ensuring optimal performance, scalability, and flexibility. Ubuntu Server, a robust and widely-used Linux distribution, serves as a reliable platform for hosting services, applications, and databases. To complement this, Logical Volume Management (LVM) offers dynamic disk management, allowing system administrators to resize, manage, and allocate storage volumes with ease. This documentation outlines the deployment of Ubuntu Server in a virtual environment and the implementation of LVM to manage disk storage effectively.

What is Ubuntu Server?

Ubuntu Server is a version of the Ubuntu operating system specifically designed for server environments. Unlike the desktop version, it does not come with a graphical user interface by default, making it more lightweight and resource-efficient. Ubuntu Server is commonly used for hosting web applications, databases, file storage, and virtual machines. It is known for its security, stability, long-term support (LTS) releases, and ease of use, making it a popular choice among both beginners and experienced system administrators.

What is LVM (Logical Volume Management)?

LVM stands for Logical Volume Management. It is a flexible disk management system used in Linux environments. Unlike traditional disk partitioning, LVM allows you to create logical volumes that can span across multiple physical disks. These logical volumes can be resized or moved without affecting data, providing greater flexibility in managing storage.

Key Concepts:

- **Physical Volume (PV):** The actual hard disk or partition prepared for LVM use.
- **Volume Group (VG):** A pool of storage created by combining one or more physical volumes.
- **Logical Volume (LV):** A virtual partition created from a volume group that can be formatted and mounted.

Why Use LVM?

- Resize volumes easily without downtime.
- Combine multiple disks into a single logical volume.
- Simplify storage expansion and backup.

Prerequisites

Before deploying Ubuntu Server and implementing LVM, ensure the following requirements are met:

- **System Requirements:**
 - At least 2 GB of RAM.
 - 25 GB or more of available disk space.
 - Ubuntu Server ISO file (e.g., ubuntu-22.04.5-live-server-amd64.iso).
 - **Software Requirements:**
 - VMware Workstation or VMware Player installed.
 - LVM2 package (usually included in modern Ubuntu installations).
 - **Technical Knowledge:**
 - Basic understanding of Linux commands.
 - Familiarity with virtual machine configuration and Linux file systems.
-

Objective:

The primary objective of this documentation is to:

- Deploy Ubuntu Server in a virtual machine using VMware for a controlled and secure environment.
 - Implement Logical Volume Management (LVM) by:
 - Adding an extra virtual hard disk.
 - Creating a physical volume.
 - Creating a volume group.
 - Dividing the volume group into multiple logical volumes.
 - Formatting and mounting each logical volume for use.
 - Understand the benefits of LVM in real-world system administration tasks such as storage resizing and flexible data management.
-

Ubuntu Server Installation – Step-by-Step Process:

Step 1: Start VMware

- Open **VMware Workstation** or **VMware Player**.
- Click **Create a New Virtual Machine**.

Step 2: Choose Configuration

- Select **Custom (advanced)**.
- Click **Next**.

Step 3: Select Guest Operating System

- Select **Linux** from the list.
- Click **Next**.

Step 4: Proceed Through Defaults

- Keep clicking **Next** until you reach the **Specify Disk Capacity** tab.

Step 5: Set Disk Configuration

- Select **Allocate all disk space now**.
- Choose **Store virtual disk as a single file**.
- Click **Next**.

Step 6: Finish Initial Setup

- Keep clicking **Next** until you see the **Finish** tab.
- Click **Finish**.

Step 7: Attach Ubuntu ISO File

- Click **Edit Virtual Machine Settings**.
- Select **CD/DVD (SATA)**.

- Choose **Use ISO Image File**.
- Click **Browse**, go to **C:\ISO**, select **Ubuntu-22.04.5-Desktop-AMD64.iso**, and click **Open**.
- Click **OK**.

Step 8: Power On the Virtual Machine

- Click **Power on this Virtual Machine**.

- On the **GNU GRUB v2.06** screen, select **Try or Install Ubuntu**.

Step 9: Begin Ubuntu Installation

- Click **Install Ubuntu**.

Step 10: Select Language

- Choose your preferred language.
- Click **Continue**.

Step 11: Installation Type

- Select **Normal Installation**.
- Check the box **Download updates while installing Ubuntu**.
- Click **Continue**.

Step 12: Confirm Settings

- Click **Continue** again.

Step 13: Set Location

- Select your **location**.
- Click **Continue**.

Step 14: Create User Account

- Enter your:
 - Name
 - Computer name

- Username
- Password
- Select **Login Automatically**.
- Click **Continue**.

Step 15: Wait for Installation

- Wait for the installation to complete.
- Click **Restart Now** when prompted.

Step 16: Post-Installation Setup

- On the **Online Accounts** screen, click **Skip**.

- On the next screen, click **Skip for Now**, then **Next**.
- Click **Ask Me Later**, then **Next**.
- Finally, click **Done**.

LVM Implementation – Step-by-Step Process:

Step 1: Add a 10GB Virtual Hard Disk

1. Shut down your virtual machine.
2. Open VM settings and click **Edit virtual machine settings**.
3. Click **Add**, choose **Hard Disk**, then click **Next**.
4. Select **SCSI** (recommended), click **Next**, and choose **Create a new virtual disk**.

5. Specify disk size as **10 GB** and click **Next**, then **Finish**.

6. Click **OK** and power on the virtual machine.

Step 2:

- Open the terminal. Switch to super user by using the command “**sudo su**”.

```

es Terminal May 23 20:29
root@ramkumar-virtual-machine: /home/ramkumar

ramkumar@ramkumar-virtual-machine:~$ sudo su
[sudo] password for ramkumar:
root@ramkumar-virtual-machine:~#

```

1. To Create the Physical Volume.

Run the command:

- **pvcreate /dev/sdb**

```

es Terminal May 23 20:46
root@ramkumar-virtual-machine: /home/ramkumar

root@ramkumar-virtual-machine:~# pvcreate /dev/sdb
Physical volume "/dev/sdb" successfully created.
root@ramkumar-virtual-machine:~#

```

2. If prompted to install lvm2, follow the on-screen instructions and confirm with Y.
3. Verify the physical volume was created or not by running the below command:

- **pvdisplay**

```

root@ramkumar-virtual-machine: /home/ramkumar

root@ramkumar-virtual-machine:~# pvdisplay
"/dev/sdb" is a new physical volume of "10.00 GiB"
--- NEW Physical volume ---
PV Name           /dev/sdb
VG Name
PV Size           10.00 GiB
Allocatable       NO
PE Size           0
Total PE          0
Free PE           0
Allocated PE       0
PV UUID           uo9fda-9EfJ-1Lk7-moa0-cH15-iH9L-8geVMB

root@ramkumar-virtual-machine:~#

```

Step 3: Create Volume Group

1. Create a volume group named lvmgrp by using the below command:

➤ **vgcreate lvmgrp /dev/sdb**

```
root@ramkumar-virtual-machine: /home/ramkumar
root@ramkumar-virtual-machine:/home/ramkumar# vgcreate lvmgrp /dev/sdb
Volume group "lvmgrp" successfully created
root@ramkumar-virtual-machine:/home/ramkumar#
```

2. To verify whether the volume group is created or not use the below command:

➤ **Vgdisplay**

```
root@ramkumar-virtual-machine: /home/ramkumar
root@ramkumar-virtual-machine:/home/ramkumar# vgdisplay
--- Volume group ---
VG Name                lvmgrp
System ID
Format                 lvm2
Metadata Areas         1
Metadata Sequence No   1
VG Access               read/write
VG Status               resizable
MAX LV                 0
Cur LV                 0
Open LV                 0
Max PV                 0
Cur PV                 1
Act PV                 1
VG Size                <10.00 GiB
PE Size                4.00 MiB
Total PE                2559
Alloc PE / Size        0 / 0
Free PE / Size         2559 / <10.00 GiB
VG UUID                G5E6JX-YwPY-2JGx-rUCh-3QQu-efMI-2Tvkxx
root@ramkumar-virtual-machine:/home/ramkumar#
```

Step 4: Create First Logical Volume (lv1 - 3GB)

1. Then, Create the first logical volume of 3GB(lv1) by using the below command:

➤ **lvcreate -n lv1 -L 3G lvmgrp**

```
root@ramkumar-virtual-machine: /home/ramkumar
root@ramkumar-virtual-machine:/home/ramkumar# vgcreate lvmgrp /dev/sdb
Volume group "lvmgrp" successfully created
root@ramkumar-virtual-machine:/home/ramkumar#
```

2. To Check whether its created or not use the below command:

➤ **vdisplay**

```
root@rankumar-virtual-machine: /home/rankumar
root@rankumar-virtual-machine:/home/rankumar# lvsdisplay
--- Logical volume ---
LV Path                /dev/lvmgrp/lv1
LV Name                 lv1
VG Name                 lvmgrp
LV UUID                 ZbbAyl-F0NG-vAfp-zG2O-1yaM-XrfM-fc8Fb0
LV Write Access         read/write
LV Creation host, time  rankumar-virtual-machine, 2025-05-23 20:59:37 +0530
LV Status                available
# open                  0
LV Size                 3.00 GiB
Current LE              768
Segments                1
Allocation               inherit
Read ahead sectors      auto
- currently set to      256
Block device            252:0

root@rankumar-virtual-machine:/home/rankumar#
```

Step 5: Format and Mount lv1

1. Create a directory using the below command:

➤ **mkdir /dirlv1**

```
root@rankumar-virtual-machine: /home/rankumar
root@rankumar-virtual-machine:/home/rankumar# mkdir /dirlv1
root@rankumar-virtual-machine:/home/rankumar# lsblk
```

2. Format the volume by using the below command:

➤ **mkfs.ext4 /dev/lvmgrp/lv1**

```
es Terminal May 23 21:10
root@rankumar-virtual-machine: /home/rankumar
root@rankumar-virtual-machine:/home/rankumar# mkfs -t ext4 /dev/lvmgrp/lv1
mke2fs 1.46.5 (30-Dec-2021)
Creating filesystem with 786432 4k blocks and 196608 inodes
Filesystem UUID: 3e66aa60-22b5-4607-b57d-e2bcad5f32b6
Superblock backups stored on blocks:
    32768, 98304, 163840, 229376, 294912

Allocating group tables: done
Writing inode tables: done
Creating journal (16384 blocks): done
Writing superblocks and filesystem accounting information: done

root@rankumar-virtual-machine:/home/rankumar#
```

3. Then, mount it by using the below command:

➤ **mount /dev/lvmgrp/lv1 /dirlv1**

```
es Terminal May 23 21:15
root@rankumar-virtual-machine: /home/rankumar
root@rankumar-virtual-machine:/home/rankumar# mount /dev/lvmgrp/lv1 /dirlv1
root@rankumar-virtual-machine:/home/rankumar#
```

4. Check mounted volumes by using the below command:

➤ `df -Th`

```
root@ramkumar-virtual-machine: /home/ramkumar# df -Th
Filesystem      Type      Size  Used Avail Use% Mounted on
tmpfs            tmpfs     387M  1.7M  386M   1% /run
/dev/sda3        ext4      24G   13G   11G  55% /
tmpfs            tmpfs     1.9G   0  1.9G   0% /dev/shm
tmpfs            tmpfs     5.0M  4.0K  5.0M   1% /run/lock
/dev/sda2        vfat      512M  6.1M  506M   2% /boot/efi
tmpfs            tmpfs     387M  100K  387M   1% /run/user/1000
/dev/cr0         iso9660    4.5G  4.5G   0 100% /media/ramkumar/Ubuntu 22.04.5 LTS amd64
/dev/mapper/lvmgrp-lv1 ext4      2.9G   24K   2.8G   1% /dir/lv1
```

Step 6: Create Second Logical Volume (lv2 - 3GB)

1. Create the second logical volume

➤ `lvcreate -n lv2 -L 3G lvmgrp`

```
root@ramkumar-virtual-machine: /home/ramkumar# lvcreate -n lv2 -L 3G lvmgrp
Logical volume "lv2" created.
root@ramkumar-virtual-machine: /home/ramkumar#
```

2. Check if it's created

➤ `Lvdisplay`

```
root@ramkumar-virtual-machine: /home/ramkumar# lvdisplay
LV Write Access      read/write
LV Creation host, time ramkumar-virtual-machine, 2025-05-23 20:59:37 +0530
LV Status             available
# open                1
LV Size               3.00 GiB
Current LE            768
Segments              1
Allocation            inherit
Read ahead sectors    auto
- currently set to    256
Block device          252:0

--- Logical volume ---
LV Path               /dev/lvmgrp/lv2
LV Name               lv2
VG Name               lvmgrp
LV UUID               lF3esK-Z3S9-qwj1-XgXB-RKZw-YUF2-S7vv1D
LV Write Access       read/write
LV Creation host, time ramkumar-virtual-machine, 2025-05-23 21:36:13 +0530
LV Status              available
# open                 0
LV Size                3.00 GiB
Current LE             768
Segments               1
Allocation              inherit
Read ahead sectors     auto
- currently set to     256
Block device           252:1

root@ramkumar-virtual-machine: /home/ramkumar#
```

Step 7: Format and Mount lv2

1. Create mount directory

➤ **mkdir /dirlv2**

2. Format lv2

➤ **mkfs.ext4 /dev/lvmgrp/lv2**

```
root@ramkumar-virtual-machine: /home/ramkumar
root@ramkumar-virtual-machine:/home/ramkumar# mkfs -t ext4 /dev/lvmgrp/lv2
mke2fs 1.46.5 (30-Dec-2021)
Creating filesystem with 786432 4k blocks and 196608 inodes
Filesystem UUID: 6c049dd0-983f-405d-96cf-c96d06b60840
Superblock backups stored on blocks:
    32768, 98304, 163840, 229376, 294912

Allocating group tables: done
Writing inode tables: done
Creating journal (16384 blocks): done
Writing superblocks and filesystem accounting information: done

root@ramkumar-virtual-machine:/home/ramkumar#
```

3. Mount lv2

➤ **mount /dev/lvmgrp/lv2 /dirlv2**

```
root@ramkumar-virtual-machine: /home/ramkumar
root@ramkumar-virtual-machine:/home/ramkumar# mount /dev/lvmgrp/lv2 /dirlv2
root@ramkumar-virtual-machine:/home/ramkumar#
```

4. Check mounted volumes

➤ **df -Th**

```
root@ramkumar-virtual-machine: /home/ramkumar
root@ramkumar-virtual-machine:/home/ramkumar# df -Th
Filesystem      Type      Size  Used Avail Use% Mounted on
tmpfs           tmpfs     387M  1.7M  386M   1% /run
/dev/sda3       ext4      24G   13G   11G  55% /
tmpfs           tmpfs     1.9G   0  1.9G   0% /dev/shm
tmpfs           tmpfs     5.0M  4.0K  5.0M   1% /run/lock
/dev/sda2       vfat      512M  6.1M  506M   2% /boot/efi
tmpfs           tmpfs     387M  100K  387M   1% /run/user/1000
/dev/sr0        iso9660   4.5G  4.5G   0 100% /media/ramkumar/Ubuntu 22.04.5 LTS amd64
/dev/mapper/lvmgrp-lv1 ext4      2.9G   24K   2.8G   1% /dirlv1
/dev/mapper/lvmgrp-lv2 ext4      2.9G   24K   2.8G   1% /dirlv2
root@ramkumar-virtual-machine:/home/ramkumar#
```

Step 8: Create Third Logical Volume (lv3 - 4GB)

Issue While Creating Logical Volume (lv3)

When trying to create the third logical volume (lv3) using the command:

➤ **lvcreate -n lv3 -L 4G lvmgrp**

The following error was shown:

Volume group "lvmgrp" has insufficient free space (1023 extents): 1024 required.

```
root@ramkumar-virtual-machine: /home/ramkumar
root@ramkumar-virtual-machine:/home/ramkumar# lvcreate -n lv3 -L 4G lvmgrp
Volume group "lvmgrp" has insufficient free space (1023 extents): 1024 required.
root@ramkumar-virtual-machine:/home/ramkumar#
```

Explanation:

In LVM (Logical Volume Manager), space is divided into extents. By default, one extent = 4 MB.

To create a 4GB volume, LVM needs:

4 GB = 4096 MB

Required extents = $4096 / 4 = 1024$ extents

But the volume group lvmgrp has only 1023 extents available, which is 1 extent short. That's why LVM shows an error.

Solution:

We adjusted the logical volume size to fit within the available extents:

➤ **lvcreate -n lv3 -L 3.9G lvmgrp**

Why 3.9G?

- 3.9 GB = 3993.6 MB
- Required extents = $3993.6 / 4 \approx 998$ extents (which is less than 1023)

By creating a volume slightly smaller (3.9G), it fits into the remaining space in the volume group and avoids the error.

1. Create the third logical volume

➤ **lvcreate -n lv3 -L 3.9G lvmgrp**

```
root@ramkumar-virtual-machine: /home/ramkumar
root@ramkumar-virtual-machine:/home/ramkumar# lvcreate -n lv3 -L 3.9G lvmgrp
Rounding up size to full physical extent 3.90 GiB
Logical volume "lv3" created.
root@ramkumar-virtual-machine:/home/ramkumar#
```

2. Check if it's created

➤ **Lvdisplay**

```
root@ramkumar-virtual-machine: /home/ramkumar

LV Write Access      read/write
LV Creation host, time ramkumar-virtual-machine, 2025-05-23 21:36:13 +0530
LV Status            available
# open               1
LV Size              3.00 GiB
Current LE           768
Segments             1
Allocation           inherit
Read ahead sectors   auto
- currently set to   256
Block device         252:1

--- Logical volume ---
LV Path              /dev/lvmgrp/lv3
LV Name              lv3
VG Name              lvmgrp
LV UUID              ADKFZd-hUWF-Frg8-u0As-x3av-e80Z-0gUh8c
LV Write Access      read/write
LV Creation host, time ramkumar-virtual-machine, 2025-05-23 21:40:30 +0530
LV Status            available
# open               0
LV Size              3.90 GiB
Current LE           999
Segments             1
Allocation           inherit
Read ahead sectors   auto
- currently set to   256
Block device         252:2

root@ramkumar-virtual-machine:/home/ramkumar#
```

Step 9: Format and Mount lv3

1. Create mount directory

➤ **mkdir /dirlv3**

```
root@ramkumar-virtual-machine: /home/ramkumar

root@ramkumar-virtual-machine:/home/ramkumar# mkdir /dirlv3
root@ramkumar-virtual-machine:/home/ramkumar#
```

2. Format lv3

➤ **mkfs.ext3 /dev/lvmgrp/lv3**

```
root@ramkumar-virtual-machine: /home/ramkumar

root@ramkumar-virtual-machine:/home/ramkumar# mkfs -t ext3 /dev/lvmgrp/lv3
mke2fs 1.46.5 (30-Dec-2021)
Creating filesystem with 1022976 4k blocks and 256000 inodes
Filesystem UUID: fbfe99df-ed2b-4cb6-9802-19d0b178b349
Superblock backups stored on blocks:
    32768, 98304, 163840, 229376, 294912, 819200, 884736

Allocating group tables: done
Writing inode tables: done
Creating journal (16384 blocks): done
Writing superblocks and filesystem accounting information: done

root@ramkumar-virtual-machine:/home/ramkumar#
```

3. Mount lv3 using the command:

➤ **mount /dev/lvmgrp/lv3 /dirlv3**

```
root@ramkumar-virtual-machine: /home/ramkumar

root@ramkumar-virtual-machine:/home/ramkumar# mount /dev/lvmgrp/lv3 /dirlv3
root@ramkumar-virtual-machine:/home/ramkumar#
```

4. Check mounted volumes

➤ df -Th

```
root@ramkumar-virtual-machine: /home/ramkumar
root@ramkumar-virtual-machine:/home/ramkumar# df -Th
Filesystem      Type      Size  Used Avail Use% Mounted on
tmpfs            tmpfs     387M  1.7M  386M   1% /run
/dev/sda3        ext4      24G   13G   11G  55% /
tmpfs            tmpfs     1.9G   0  1.9G   0% /dev/shm
tmpfs            tmpfs     5.0M  4.0K  5.0M   1% /run/lock
/dev/sda2        vfat      512M   6.1M  506M   2% /boot/efi
tmpfs            tmpfs     387M  100K  387M   1% /run/user/1000
/dev/sr0         iso9660    4.5G  4.5G   0 100% /media/ramkumar/Ubuntu 22.04.5 LTS amd64
/dev/mapper/lvmgrp-lv1 ext4       2.9G   24K   2.8G   1% /dirlv1

```

Step 10: Verify Logical Volumes and Mounts with lsblk

After creating and mounting all logical volumes, use the following command to check the block devices, volume group structure, and mount points:

➤ lsblk

This command shows a tree-like structure of all available block devices, their partitions, logical volumes, and where they are mounted.

This helps verify:

- The logical volumes lv1, lv2, and lv3 are created.
- They are part of lvmgrp.
- They are mounted to /dirlv1, /dirlv2, and /dirlv3.

```
root@ramkumar-virtual-machine: /home/ramkumar
root@ramkumar-virtual-machine:/home/ramkumar# lsblk

Conclusion

In this documentation, we successfully demonstrated the deployment of Ubuntu Server in a virtualized environment using VMware and implemented Logical Volume Management (LVM) for flexible disk management. Ubuntu Server provides a reliable and efficient platform for hosting services, while LVM offers powerful tools to dynamically manage storage.

Through the step-by-step process, we learned how to:

- Install Ubuntu Server in a virtual machine.
- Add a new virtual hard disk.
- Create physical and logical volumes using LVM.
- Format and mount the logical volumes for practical use.
